How to covert .ipynb to slides using nbconvert?

I created ipython notebook and I am be able to convert it to HTML and PDF. But when I tried to convert to it slides it turned out just like HTML on one file. Here is the code I use from a terminal prompt:

```
$ ipython nbconvert --slides Testing.ipynb --post serve
```

I want to create slides and I appreciate your time and help!

terminal ipython ipython-notebook google-api-python-client

Sounds like [this issue](#). What version of IPython are you on? If less than 3, try upgrading. – [Thomas K](#) Mar 8 '15 at 0:20

Ipython is up to date and mine is version 3.0.0 @ [Thomas K](#). – [ocean](#) Mar 9 '15 at 3:04

Any errors in the terminal or the JS console when you open it up in the browser? – [Thomas K](#) Mar 9 '15 at 6:06

When you wrote "it turned out just like HTML on one file" did you mean that the converted html file was displayed as a single page? another Q, in which browser is the converted file loaded? – [gboffi](#) Mar 11 '15 at 15:17

1 Answer

Adding the following extra option to your code might solve the problem.

```
--reveal-prefix "http://cdn.jsdelivr.net/reveal.js/2.5.0"
```

Hope it helps.

1 Your generous help is appreciated and it worked ! @tanemaki – [ocean](#) Mar 24 '15 at 17:29

You can also change theme and transition for eye-candy by adding extra code at the end of URL displayed on your web browser. Assuming the URL is `http://127.0.0.1:8000/Testing.slides.html#/`, changing the url to `http://127.0.0.1:8000/Testing.slides.html?theme=sky?transition=convex` will add some visual effect to your presentation. For the version 2.6.2 or 2.5.0 of reveal.js, the following themes and transitions seem to be available: theme - simple (default), sky, beige, solarized, serif, night, moon transition - none, fade, slide, convex, concave, zoom .Happy coding ;) – [tanemaki](#) Mar 26 '15 at 9:25

Thank you very much and definitely added a nice visualization to slideshows.@tanemaki – [ocean](#) Mar 27 '15 at 18:24
